

E-Discovery Software with Inventory Option

Lindsey Jahn, Associate Editor

Relativity 8.1 software is an update that introduces a new inventory option for gaining insight into and filtering data prior to processing. This software features 60% faster import speeds and end-to-end processing speeds that are almost twice as fast. An intuitive interface and easy-to-use filters allow users to exclude obvious junk or irrelevant files before fully processing data into a review workspace. A new report in Relativity Assisted Review provides a summary of each project's results and key statistics in one place. Common workflows are streamlined, and new options for sampling documents and saving static lists offer more flexibility throughout a review project.
