

Machine Guarding Device

Lindsey Jahn, Associate Editor

The Guardian Defender™ is designed with the latest regulations and most demanding manufacturing process in mind. It can safeguard machinery in many manufacturing environments. Anywhere a machine operator interfaces with a machine, robot or process is a suitable application for this unit. Visibly safer than light curtains, the system combines safety interlock switches and controls capable of achieving up to PLe, Category 4 level safety with a movable physical barrier restricting access to dangerous machine movement, while at the same time containing process driving hazards such as weld flash/sparks, flying debris, mist, spray and other containment and exposures.
