

Software for Storage Bins

Lindsey Jahn, Associate Editor

Company has introduced a new version of the eBob software that is designed to help users gather real-time inventory data from storage bins. The program works in conjunction with SmartBob remote level sensors to provide measurement data to personal computers. The release of eBob version 5.2 includes the ability for users with a LAN, WAN or VPN to access the bin level measurement from one or multiple eBob Server (remote) locations on the network. This software helps users more effectively manage bin levels without having to manually inspect and measure each bin, saving valuable time while optimizing bin levels and storage capacity. It provides affordable inventory tracking for any size operation by using computer-based technology to provide detailed information.
