

Wastewater Treatment System

Lindsey Jahn, Associate Editor

The DEMON® treatment system removes nitrogen from wastewater. The system provides reliable performance and benefits over traditional nitrification-denitrification systems, making it suitable for food and beverage processing facilities that have wastewater streams with high ammonia concentrations. This system not only reduces pollutants in wastewater, but can also play a role in wastewater treatment energy self-sufficiency. The reductions in carbon source and energy consumption also lead to reduced treatment costs. Other product features include:

- Reductions in ammonia load
- Reduced sludge handling volumes
- Less greenhouse gas production
