

Diagnostic Assay for Winemakers

Lindsey Jahn, Associate Editor

Veriflow® BRET is a rapid diagnostic assay to detect Brettanomyces, a wine-spoiling yeast. Veriflow technology to detect microbes of concern in food production and distribution. The patented technology provides the same data as the USDA reference methods, but minimizes the time, reduces the cost, and lowers the overhead associated with conventional diagnostics. Current methods of on-site testing for Brettanomyces are time consuming which can allow continued compound accumulation and delay corrective measures, making wine subject to spoilage. Company's product suite currently tests for Listeria species, Salmonella species, Campylobacter and Listeria monocytogenes.
