

Entry-Level VFFS Technology

Lindsey Jahn, Associate Editor

The entry-level SVI 2600 VFFS machine is suitable for a range of industries, including confectionery, snacks, grains and other food and non-food products. The machine caters to the needs of small- and mid-sized companies seeking to automate their packaging processes, while providing large manufacturers with a cost-effective option for small-volume processing or for test marketing new products. It incorporates the same proven technology employed on higher-end baggers, such as servo-driven cross-sealing units, vacuum belts and Bosch/Beckoff controls for reliable, high-efficiency packaging. The intermittent motion bagger can easily be combined with existing equipment and produces pillow, side-gusseted and block-bottom bags at rates up to 120 bags per minute.
