

Powder & Scoop Insertion Packaging System

Lindsey Jahn, Associate Editor

The Star Auger and Swifty Bagger are paired with an optical scanner for the most accurate scoop insertion system available. This new approach guarantees that each bag gets one insert, eliminating either having multiple scoops or no scoops in a sealed bag. The Swifty is designed with two filling stations, both of which come equipped with sensors. Powder is first filled into a stand-up pouch while the scoop inserts are disbursed through the bowl dispenser. The scoops are dropped into a funnel awaiting the bag at the second fill station. The "no bag, no fill" feature is extended to the scoop inserter. If the scoop is not deployed, the bag will remain unsealed so an insert can be added. If the sensor detects multiple inserts, it diverts the extras to a holding area to be used at a later time.
