

# Field Potato Sorter

Lindsey Jahn, Associate Editor

Field Potato Sorter (FPS) is a high-throughput optical sorter for unwashed potatoes, enabling processors and packer companies to lower labor and potato storage costs while raising product quality and yield. The compact, waterproof, user-friendly machine is available in various widths to fit all specific capacities up to 70,000 kilos an hour. Product is compatible with other potato grading equipment, but can also be used alone to sort harvested potatoes before or after storage. Processors can use measurements the FPS makes and records, with predictive analysis, to optimize procedures within their operations.
