

Liquid Filter Housing

Lindsey Jahn, Associate Editor

The P-FG Series of liquid filtration housings is designed to filter process water, mineral water, beer, wine, soft drinks, juice and other liquids. When cost-effective stainless steel housings are required, this product provides a housing option with shorter lead times. The range is also suitable for applications with flow rates up to 1,000 gpm. Seven standard sizes cover a wide range of flow rates, depending on element selection. Custom housings are available upon request.
