

Palletizer with Accumulation Table

Lindsey Jahn, Associate Editor

Company's Model 72AE palletizer combines the economy and accessibility of a floor-level palletizer with the speeds typically associated with high-level machines. This design incorporates an extended accumulation table that allows continuous layer forming during completed layer transfer and stacking, thereby achieving increased volume of up to 35 units per minute. Energy-efficient electric motors provide smooth, quiet operation, and all layer patterns and pallet configurations are programmed for easy startup and control. Product can palletize cases, trays, bags or totes. Changeover is automatic by choosing the next product configuration at the operator touchscreen panel. The palletizer's intelligent control gives packagers total flexibility as new pallet, layer and product configurations are added and/or modified by authorized personnel and all operating parameters can be adjusted independently.
