Put Wall System

Lindsey Jahn, Associate Editor

Company's Put Wall System is an order fulfillment solution for piece picking applications. The scalable and modular solution accommodates the changing operational requirements of the order processing environment. Product is a goods-to-person workstation, enabled by Company's order fulfillment software, which contains a standard and configurable put wall solution set for store replenishment. Algorithms within the software manage and direct complex piece picking functionality for batch picking optimization. The process includes a 100% quality check by scanning each item at the put wall. Order processing is efficient since picking has critical mass volumes and order consolidation is integrated with the packing function. Overall labor productivity and ergonomic operation are realized. The entire process is paperless and managed in real time within Company's software.
