

# Sample Taking Valve

Lindsey Jahn, Associate Editor

The FAMAT Sample Taking valve is capable of taking different types of sample materials, such as powders pastes, slurries and liquids, from a process vessel/tank or pipe while the process is still operating under pressure or vacuum. The model 125-S2 is the only such product that offers complete protection against mishandling by the operator during sampling operation. This extra layer of protection prevents the loss of sample material and protects the valve. The product is offered in a wide range of styles and sizes, along with various levels of containment and automation.
