

Brushless Motors

Lindsey Jahn, Associate Editor

The DCmind Brushless direct current motor series includes the TNi21 and SMi21 models that feature integrated electronics, power capabilities from 60-150 Watts and high accuracy. An optimized control loop allows simple and accurate motor management. Other features include carefully designed internal thermal protection for improved safety and an intuitive, easy-to-use software. EMC characteristics ensure operational safety and reliability. Available options include mechanical brake and a variety of planetary and worm gearboxes. Either model can be used as a stand-alone unit, in combination with other motors or controlled by a PLC.
