

Data Management Software

Lindsey Jahn, Associate Editor

ProdX is an advanced connectivity software program that allows centralized monitoring, control and data documentation for Company's checkweighers, metal detectors and X-ray systems, whether operating in one location or multiple facilities. The program boosts process productivity, improves control of product quality, and provides robust operational security and total clarity for your product inspection program. Multiple product inspection devices can be integrated into a central monitoring system that can be monitored from multiple locations. The user interface features color-coded machine icons that provide at-a-glance device status and health.
