

Entry-Level Thermoformer

Lindsey Jahn, Associate Editor

The R 085 entry-level model for thermoforming packaging can be used for running both flexible and rigid films. This model is aimed at companies in a wide range of sectors. The machine is available with four standard format layouts. It is suitable for packing both sliced products and individual items. The machine can be used to produce packs with inert gas as well as vacuum packs, so users can also meet the requirement for extended shelf life for their packaged products. With its thermoforming depth of up to 80mm, the unit provides a range of possibilities for pack design. Electric drives are used for both the lifting units and the transport chain.
