

Sodium Analyzer

Lindsey Jahn, Associate Editor

The Sodium Analyzer specifically measures the concentration of sodium to provide simple, fast and accurate results so laboratories and manufacturers can improve the taste of products and comply with recognized standards. The device eliminates the need for complex instruments. It uses integrated and dedicated sodium evaluation algorithm to deliver highly accurate and repeatable results comparable to those achieved using more complex analytical techniques. Because the sodium ions are measured directly, the device provides fast and accurate results, which are not compromised by the presence of other chloride compounds.
