

Stainless Steel Mobilized Storage System

Lindsey Jahn, Associate Editor

The ActivRAC® 7M-SS (Stainless Steel) mobilized storage system is designed to meet the increasing demand for more storage capacity in clean room or corrosive environments. The stainless steel construction can withstand the most demanding and harsh environments, including temperatures below -4 degrees Fahrenheit. It can also withstand caustic cleaning solutions. The system has been designed with food manufacturing, clean rooms and freezer/cold storage applications in mind. The system provides flexibility to expand, move or reconfigure, as well as the ability to travel over flat, but non-level floors, using unique designs and technology.
