

Double Flange Slide Gate Valve

Double flange slide gate valve is a slim, lightweight alloy design featuring a stainless steel slide gate as standard, anti-tamper locking — allowing the user to lock or tag the valve in the closed position, and grounding points, where static charge can be a problem. Product is also available with a pneumatic actuator assembly, which can be added as a simple retro-fit or removed to return to a basic hand operation. Product is used for applications requiring a flange connection at the outlet. The valve features rich solution for the isolation of gravity fed, free flowing powders or granules, where frequent operation is not a requirement.
