

Filling System

High output filling system with Easy-Load™ rotary bag hanger system brings all bag strap connection points directly in front of the operator for quick and easy access. The system extends bag fill carriage 24" towards operator for reach-free bag attachment. After bag connection and inflation, the bulk bag is filled by weight to a programmed set point. Once the fill cycle is complete, the bag inlet spout and straps release, the fill head raises, and the filled bag is discharged with a powered roller conveyor. Heavy-duty bulk bag densification system settles product for enhanced stability. Allen-Bradley Control-Logix PLC controls provide access to system status, recipes and operational parameters. Systems are custom designed for your application requirements.
