

Powder Against PEDv

Powder fights Porcine epidemic diarrhea virus (PEDv), a coronavirus infecting the small intestines of a pig, causing diarrhea and often death. While the virus was first noticed in Europe, it spread throughout the U.S. in 2013, killing over 1 million piglets and resulting in higher hog prices. This powder is a disinfectant proven to eliminate PEDv in controlled environments. Product is an EPA registered sanitizer that can either be dissolved in water and applied to the surfaces as a spray/foam, or the product can be used as a dry floor surface disinfectant applied to surfaces as a dry granule for slow release. Product fights against resistant organisms, providing the industry with a versatile, validated means to kill swing pathogens and slows the virus's spread.
