

Single Filer Conveyor

Single filing conveyors in low pressure designs meet the most demanding applications and production speeds while offering product stability in the process. Accumulation or mass-flow production streams effortlessly into a single lane for constant, steady operation at progressively higher line speeds. Traditionally used for bottles, cans, containers and other round or irregular shaped product single filing, these conveyors are capable of handling complex irregular shaped containers. Guide rails mounted along the conveying surface are instrumental in shifting articles toward the engager while relieving back-pressure. Available in variable speed configurations, these conveyors ensure product moves smoothly and safely to their next in-line destination. Product can be integrated into existing lines for optimum flexibility. Product can be constructed of mild steel or stainless steel based on your particular specifications. Although plastic belt conveyor design is typical for these designs, product is also available in plastic chain configurations upon request and can manufacture in-line or off-line designs.
