

Slicing System

This slicing system reduces giveaway, increases yields and maintains product integrity with a patented independent drive technology. The technology provides complete automated control of each log being delivered to the blade. Each drive will continually adjust the feed rate to accommodate for the variations in the log it is feeding to ensure precise weight control of each sliced portion. For natural or irregularly shaped products, the slicer can be teamed with the scanner to record the 3D image of the product along with its weight to proactively determine how best to slice the product for minimal giveaway, consistent slice thickness within a draft and the highest yields. Multiple product loaves can be sliced simultaneously to maximize throughput while maintaining precise portion control.
