

Durable Floors

In addition to being sustainable-, chemical-, abrasion- and impact-resistant, Company's epoxy and urethane-based floors perform in extreme heat and cold, resisting both thermal shock and cycling. Stonclad and Stonshield systems are textured to prevent slips and falls, and they stand up to oxidizing agents, organic acids and CIP chemicals. The floors are also pitched to drains to prevent standing water from forming puddles and compromising sanitary regulations. The floors are seamless, so there are no joints to trap dirt and bacteria, keeping facility floors clean. The floors have a low VOC content and incorporate recycled and rapidly renewable materials into their formulation, helping projects accumulate points as they pursue LEED certification.
