

Versatile Former

The 710-V Forming Machine provides excellent weight control and gentle product handling for a variety of products from beef to vegetables. It can form hamburger patties, meatballs, skinless sausage links and more. The unit now offers more versatility with Integrated Variable Speed Control. This model allows production cycling rates to be adjusted from 15 to 60 cycles per minute to achieve the right speed for every application. This capability gives operators the ability to adjust the cycling rate of the machine to allow for more fill time for very heavy weight portions. It is also convenient for difficult-to-form special blends that require an additional amount of fill time and torque for consistent and accurate filling. All of these features are incorporated into a NEMA 4 Control Cabinet that allows for complete washdown capability and ease of access.
