

Imaging Particle Analysis System

Food Manufacturing Staff

Company has introduced remote operation for the automated FlowCAM® imaging particle analysis system. The remote desktop capability enables operators to start running a sample, monitor its progress, adjust measurement parameters on-the-fly and analyze images and data in real-time, all while working on other tasks away from the instrumentation and without requiring direct supervision. Accessible at the processing line, while attending meetings, on research vessels, outside in the field and at other on-site and off-site locations, the system may be operated remotely on Android-based computer tablets, iPads and other tablets using all of the same controls and interactive features available on the desktop instrumentation.
