

# Energy-Saving Conveyor Belt

Food Manufacturing Staff

The CompactGrid™ conveyor belt is engineered with 70% open surface area and provides optimal performance in processes where product coating, drainage and liquid or air circulation are factors. The system's flow-through capabilities will reduce the time required to heat up or cool down a product, reducing energy costs. The increased open area combined with flow-through characteristics enables easier and more thorough cleaning and sanitation of conveyor systems. When replacing a plastic modular belt, this unit increased cleaning efficiencies by 66%.
