

Safety Interlock Switch

Food Manufacturing Staff

D4SL-N Safety Interlock Switches are available with four-, five- or six-contacts to satisfy varied application needs. The IP67-rated unit can be mounted in four different directions without needing to rotate the head. Two wiring methods minimize wiring time and make possible one-touch attachment and removal. Easy-to-view LED indicators allow users to quickly check switch status from any direction. The item delivers a minimum of one million operations and boasts a minimum key holding force of 1,300 N. It is available with two types of wiring. Connector-type wiring models feature a connector cable that reduces potential for mis-wiring, facilitates fast maintenance and allows easy switch replacement. Terminal block-type models include a detachable terminal block to significantly increase wiring efficiency.
